

Trisamine (TRIS)

Trisamine Resin, MP, is a macroporous polystyrene resin functionalized with a trisamine end group. It is a highly proficient scavenger of a variety of electrophilic species.

This product is capable of scavenging acids resulting from sulfonylations and acylations. It is also proficient in scavenging the excess acid and sulfonyl halides as well as isocyanates. The three amino groups allow for higher levels of scavenging per single resin particle, depending on steric bulk of the electrophile. MP-Trisamine is equally proficient in sequestering organometallic species from reactions. It is available in multiple varieties including, Silica and Fine.
