

Borohydride (BH_4^-)

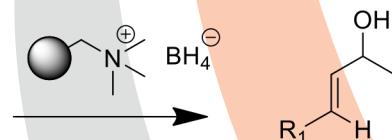

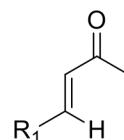

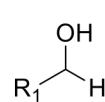

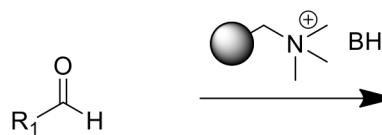

Borohydride Resin, MP, is a macroporous resin functionalized with a tetraalkylammonium borohydride end group. It is a commonly utilized reagent for the conversion of carbonyl containing moieties to alcohols. It is a free flowing solid. The resin provides greater control over reactivity when compared to solution borohydride, providing selectivity of aldehydes>ketones>double bonds. This control allows researchers to reduce α,β - unsaturated carbonyls to the corresponding alcohols without adversely affecting the integrity of the double bond.

Reductive amination in the presence of Titanium(IV) Isopropoxide has been reported. Following reaction, the excess Ti(OiPr)_4 is scavenged with DEAM resin and the desired amine product is isolated via 'Catch and Release' methodology utilizing MP-TsOH.

Standard carbonyl reduction protocol involves agitation of the reaction solution with excess MP-Borohydride in methanol or ethanol, followed by filtration and concentration of the filtrate to pure alcohol.

General Reaction
